## **APPENDIX 2J**

# **ADDITIONAL MERCURY MEASUREMENTS: 2011**

## 2J.1 INTRODUCTION

Keeyask water quality studies conducted up to 2011 applied an analytical detection limit sufficiently low to facilitate comparisons to the MWQSOGs for mercury for PAL issued in 2002 (Williamson 2002). The 2002 PAL guideline for mercury (0.0001 mg/L) is notably higher than the revised guideline issued in 2011 (0.000026 mg/L; MWS 2011). To provide baseline data for the study area that can be compared to the current PAL guideline, a sampling program was undertaken in fall 2011. The following provides a brief description of the methods and results of this study.

## 2J.2 METHODS

Water samples were collected from six sites as illustrated in Map 2J-1 on 12 and 13 October 2011 for analysis of total mercury, dissolved mercury, and total methylmercury. Samples were also collected for analysis of dissolved methylmercury but were preserved incorrectly at the analytical laboratory and had to be discarded. Samples were collected as surface grabs (approximately 30 cm below the water surface) at each of the sites by directly filling the sample bottles provided by the analytical laboratory.

Quality assurance/quality control procedures included the use of the clean-hands-dirty-hands procedure for ultra-trace mercury and standard measures to prevent sample contamination. Samples were kept cool (approximately 4°C) and in the dark until submission to a Canadian Association for Laboratory Accreditations, Inc. accredited analytical laboratory (ALS Laboratories, Winnipeg, MB) within 48 hours of collection. In addition, one field blank and one trip blank were submitted with the environmental samples and a duplicate sample was collected from a random site.

## 2J.3 RESULTS

Total mercury, dissolved mercury, and total methylmercury were not detected in any samples collected upstream and downstream of the Kelsey GS, Gull Rapids, or the Limestone GS or from the field and trip blanks (Table 2J-1).
