This report should be cited as follows:

Klassen, C, Y. Michaluk, S. Kirchmann, and L. Boudreau, 2024. Lake Sturgeon production and stocking summary for Birthday Rapids and Burntwood River populations, October 2022 to September 2023: Year 2 Operation. Keeyask Generation Project Fisheries Off-Setting and Mitigation Report #FOMP-2024-01. A report prepared by Manitoba Hydro, June 2024.

# SUMMARY

## BACKGROUND

Construction of the Keeyask Generation Project at Gull Rapids began in July 2014 and was completed in March 2022. Before government allowed construction to begin the Keeyask Hydropower Limited Partnership (KHLP) had to prepare a plan outlining activities that could reduce the potential effects of the Keeyask Generation Project on fish in the Nelson River (the Fisheries Offsetting and Mitigation Plan, FOMP). The plan also explained how the proposed activities would be completed and monitored.

Activities directed at Lake Sturgeon (*Namao* in Cree) were included in the plan because of its importance to the partner First Nations, because the population in Gull and Stephens lakes were low before the Project, and because the generating station will change or destroy habitat used for spawning and early life stages both upstream and downstream.

In 2017, the Committee on the Status of Endangered Wildlife in Canada (COSEWIC) reviewed and maintained the previous (2006) recommendation of listing the Nelson River population of Lake Sturgeon as Endangered. The goal of the KHLP is to have self-sustaining populations of Lake Sturgeon in this area in the future. To help achieve this, the KHLP has made a commitment to produce and release hatchery-reared sturgeon into the Keeyask area (i.e., Keeyask reservoir and Stephens Lake) and the Burntwood River until there are self-sustaining populations. These two areas are stocked in alternate years using the offspring from adults captured at Birthday Rapids on the Nelson River and First Rapids on the Burntwood River.

This report describes the hatchery production and stocking activities of Lake Sturgeon from October 2022 to September 2023.

**Lake Sturgeon feeding on bloodworm at the Grand Rapids Fish Hatchery**

## STOCKING PROGRAM

Lake Sturgeon are produced at the Grand Rapids Fish Hatchery (GRFH) located in Grand Rapids, MB from the eggs and milt (sperm) of wild adults. Offspring are reared in fiberglass troughs using well water. Fish are started on a diet of newly hatched brine shrimp and later transitioned to frozen bloodworm.

Lake Sturgeon are released as yearlings (12 months old) after spending their first winter in the hatchery. However, due to limited tank space, it is often necessary to release some of the sturgeon as fingerlings (3 to 4 months old) prior to winter. In the past, the hatchery also stocked larvae (less than 1 month old) but are no longer able to do that due to current virus testing criteria which require that the sturgeon be at least 9 weeks old. Virus testing before stocking is necessary to ensure hatchery fish do not increase the amount of Namao Virus present in wild populations. The virus does not appear to effect adults but can cause mortality among young sturgeon.

Prior to release, yearlings are marked with uniquely numbered Passive Integrated Transponder (PIT) tags, inserted into the muscle along the fish's back. PIT tag scanners held over the fish can detect a tag and display the number on a screen. This marking technique helps to identify hatchery-reared fish caught in the river and can be used to assess the movement and growth of individual fish following stocking. Fish released as fingerlings are not large enough to be PIT tagged. Instead, tissue samples from individuals representing all family groups are preserved to provide a genetic 'fingerprint', allowing future identification of stocked individuals.

**PIT tagging activities at the Grand Rapids Fish Hatchery**

Since 2013, when the KHLP began producing Lake Sturgeon, larvae, fingerlings, yearlings and two-year old’s have been stocked (see table below).

**Summary of Lake Sturgeon stocking in the Keeyask area since 2014**

Year	Burntwood River/Split Lake			Keeyask reservoir			Stephens Lake		
	Larvae	Fingerlings	Age-1+	Larvae	Fingerlings	Age-1	Larvae	Fingerlings	Age-1

**BURNTWOOD RIVER POPULATION (2022 YEAR-CLASS)**

**Hatchery Production**

Eggs and milt were collected in spring 2022 from spawning adults captured in the Burntwood River downstream of First Rapids.

A total of 800 Burntwood River fingerlings consisting of four family groups (F1M1, F1M3, F1M6, F1M7) remained at the hatchery for the 2022/23 winter. They were raised in the recently renovated Pickerel Place in order to not subject the main hatchery building’s new equipment to iron and minerals within the source well water until additional improvements are completed. Survival from the beginning of October 2022 until the spring stocking in late May/early June 2023 was 99%.

**Stocking**

In spring 2023, a total of 795 Lake Sturgeon yearlings were released. One group of yearlings (398 fish) was transported by truck on May 30 to a location near where the Burntwood River flows into Split Lake. The fish were released by boat into Split Lake with assistance from Manitoba Hydro’s boat patrol crews (Site 1; see map below). On June 1 another group (397 fish) was transported by truck to the Orr Creek boat launch and released into the Burntwood River from shore (Site 2; see map below). On average, yearlings were 21 cm long and weighed 32 g.

**Release sites for Burntwood River sturgeon (2022 year-class) stocked into Split Lake (Site 1), the Burntwood River (Site 2). Stocked sturgeon were the offspring of spawning adults collected downstream of First Rapids (Site A).**

## **BIRTHDAY RAPIDS POPULATION (2023 YEAR-CLASS)**

### **Spawn Camp**

Gillnetting took place between May 27 and June 8, 2023 along the Nelson River downstream of Birthday Rapids (see map below). Despite the capture of several milting males, no females suitable for use as broodstock were captured. Field crews ended the spawn camp when temperatures had been over 13°C (the upper limit for spawning activities) for several days.

### **Hatchery Production**

No 2023 year-class of sturgeon was produced for the KHLF (see above).

### **Stocking**

No Lake Sturgeon fingerlings were stocked in fall 2023 for the KHLF (see above).

### Location of Birthday Rapids (A) and the Birthday Rapids Spawn Camp (B)

## STOCKING RESULTS

Since the stocking program began in 2013 a total of 600,967 larvae, 21,870 fingerlings, 6,340 yearlings and 188 sturgeon aged 2-years have been released by GRFH for the KHLF. Annual monitoring programs being conducted by the KHLF in the Keeyask and upper Split Lake areas have captured a total of 849 hatchery-reared sturgeon released as yearlings or aged 2-years. Annual survival of stocked yearlings in Stephens Lake, Keeyask reservoir and upper Split Lake area has been estimated to be 86%, 95% and 92%, respectively.

## FUTURE ACTIVITIES

No hatchery-reared sturgeon are available to be stocked as yearlings in spring 2024. Planning is underway to ensure the best possible chance of collecting eggs in spring 2024.

Further upgrades to the infrastructure at GRFH are expected to be completed by spring 2024.

# 1.0 INTRODUCTION

In June 2012, the Keeyask Hydropower Limited Partnership (KHLP) filed an Environmental Impact Statement (EIS) in support of the Keeyask Generation Project (the Project), a 695 megawatt hydroelectric generating station (GS) to be built at Gull Rapids on the Nelson River (Map 1). Construction of the Project began in July 2014 following regulatory approval and was completed in March 2022.

As discussed in the EIS, construction and operation of the Project will result in the alteration and destruction of Lake Sturgeon habitat, thereby potentially affecting regional populations.

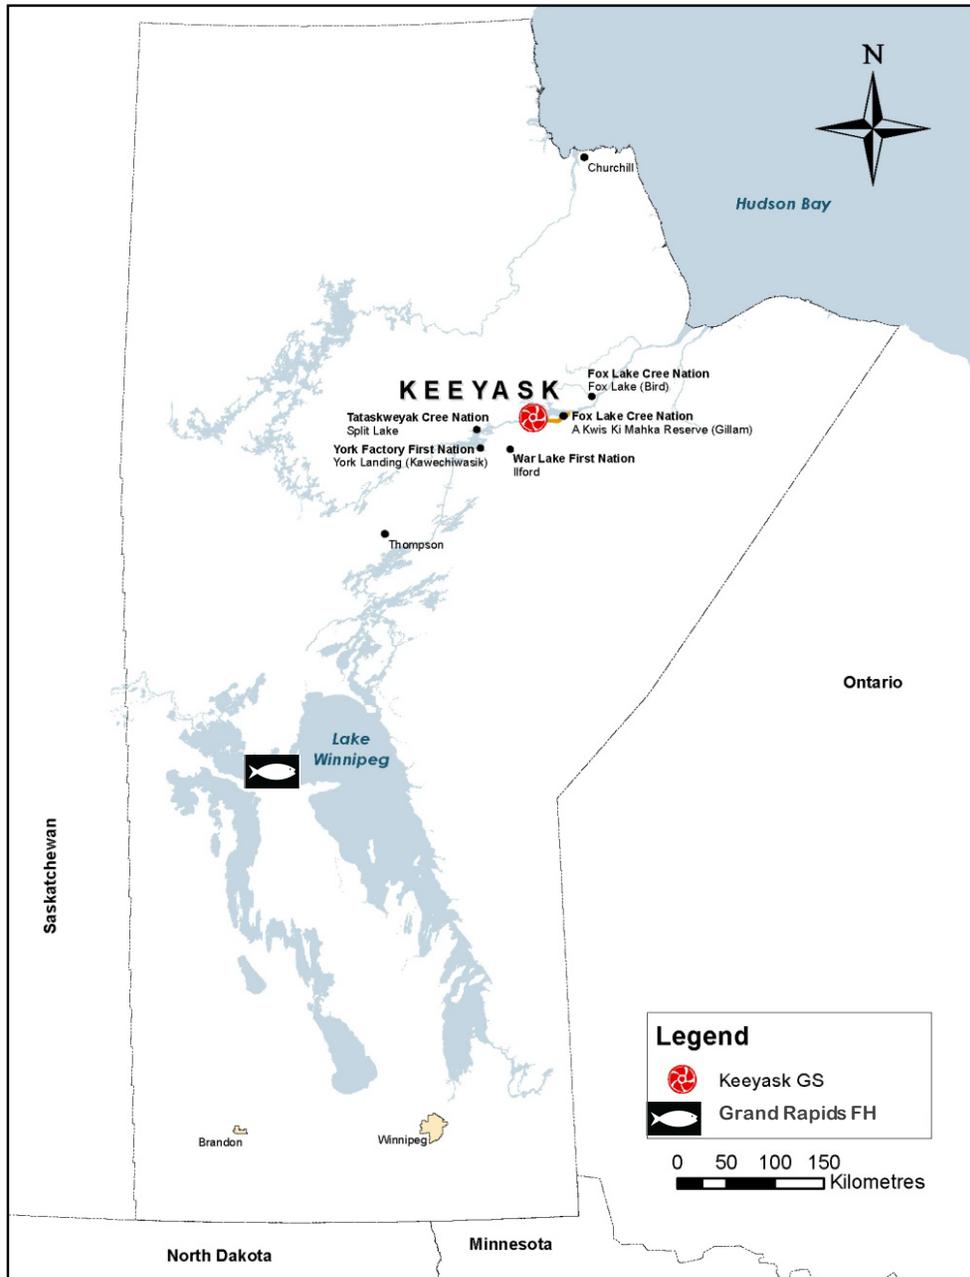

To mitigate impacts of the Project, the KHLP has developed a strategy that involves several components, including:

- management measures during construction to avoid mortality of sturgeon;
- stocking of sturgeon into Stephens Lake during construction to offset potential effects of the loss of spawning habitat in Gull Rapids;
- spawning habitat creation in the tailrace of the GS;
- alternations to habitat upstream of Birthday Rapids, if post-Project monitoring demonstrates that this area is no longer suitable for spawning sturgeon;
- creation of young-of-the-year rearing habitat at the upper end of Gull Lake following impoundment, if post-Project monitoring demonstrates that suitable habitat is not available;
- on-going studies to determine requirements (if any) for upstream fish passage;
- the use of monitoring of downstream movements and mortality to determine the need for any additional fish protection measures related to downstream passage at the GS;
- a conservation stocking program, with the objective of re-establishing a self-sustaining Lake Sturgeon population; and
- a conservation awareness program, highlighting the vulnerability of Lake Sturgeon.

Stocking was identified as being critically important because Stephens Lake may be able to support more Lake Sturgeon than are currently present. Therefore, a conservation stocking plan for the lower Nelson and Burntwood rivers was designed to address:

- existing low population numbers due to historic effects;
- potential effects of creation of the Keeyask reservoir, including possible emigration of adult Lake Sturgeon in response to water level changes at impoundment, and reduced year-class strength in the initial years of impoundment due to changes in spawning and young-of-the-year habitat. These effects are predicted to be restricted to the first years of impoundment, if they occur at all; and

- potential decrease in year-class strength of sturgeon in Stephens Lake, due to the alteration and ultimate loss of spawning habitat in Gull Rapids during construction of the GS. This effect is offset during the operation phase by the constructed spawning habitat.

**Map 1: Location of Keeyask Generation Project and Grand Rapids Fish Hatchery**

An initial 10-year stocking plan was developed and described in the Fisheries Offsetting and Mitigation Plan (FOMP). During the initial 10-year plan, the number of sturgeon released at each developmental stage (larval, fingerling and yearling) will be dependent upon:

- the number of Lake Sturgeon available at each developmental stage;
- the amount of hatchery space available to enable ‘normal’ growth of fish; and
- the end goal of maintaining 2,000 fingerlings annually through the winter to be released as yearlings the following spring.

Lake Sturgeon stocking in the lower Nelson and Burntwood rivers began in 2014 and has included the release of multiple stages over the years (Table 1).

**Table 1: Summary of Lake Sturgeon stocking in the lower Nelson River, Burntwood River and upper Split Lake since 2014**

<sup>b</sup> two-year old sturgeon

The Keeyask Fisheries Regulatory Review Committee (which also undertakes the role of Lake Sturgeon Advisory Committee as described in the *Environment Act* licence) may decide to modify the stocking plan based on annual monitoring activities.

Lake Sturgeon stocking in the lower Nelson and Burntwood rivers will continue until self-sustaining populations are established. At present, it is anticipated that stocking will occur for at least one full generation (25 years) to restore the historically depleted population.

To meet the goals outlined in the FOMP, the KHLP is stocking Lake Sturgeon hatched at the Grand Rapids Fish Hatchery (GRFH). The hatchery, located in the community of Grand Rapids, MB (Map 1), was constructed in the early 1970’s by the province of Manitoba. The building was originally configured for production of Walleye, Whitefish and a variety of trout species. In 1994, GRFH began producing Lake Sturgeon for the Nelson River Sturgeon Board, in support of efforts to conserve populations in the upper Nelson River.

Manitoba Hydro purchased GRFH in 2007 and the facility was operated in partnership with the Province. At the end of 2012, Manitoba Hydro assumed full operation of the hatchery and currently employs eight permanent and two seasonal staff. Operations and regulatory matters are overseen

by Manitoba Hydro's Generation Environmental Services Department. GRFH recently filled a new permanent position to support on-going maintenance of the facility's expanding infrastructure.

Since 2012, GRFH has focused its production efforts exclusively on Lake Sturgeon and Walleye. Rearing space for the Lake Sturgeon is shared between the two stocking programs: Keeyask Generation Project and the Nelson River Sturgeon Board.

To meet future annual stocking targets, Manitoba Hydro has upgraded and expanded rearing capacity at GRFH. In March 2014, a facility assessment was completed by HDR Inc. which confirmed that the existing infrastructure could not meet projected Lake Sturgeon production commitments. Upgrades were also necessary to attain national and provincial biosecurity standards and recommendations to reduce the risk of pathogens from entering the facility and spreading.

Planning for infrastructure upgrades and expansion of GRFH began at the end of 2014 and managed by Manitoba Hydro's Generation Projects Department. A final design was completed by SNC Lavalin in spring 2019 and a contract was awarded to NME Construction Services in fall 2019.

Pickerel Place (Photo 1), was commissioned in November 2020 and is serving as the interim sturgeon production facility until renovations in the main hatchery building are completed. Commissioning and handover of the main hatchery building was initially attained in October 2021; however, well water issues causing iron and calcium build-up within the new systems has led to the need for additional water treatment equipment. Final commissioning is expected to be completed by spring 2024, after which time Pickerel Place will be dedicated to GRFH's Walleye program.

Pickerel Place houses two separate water recirculating aquaculture systems (identified as System 4000 and 4100), each with two grey rearing troughs measuring 8.1 x 0.9 x 0.5 m (L x W x H; Photo 2). Each tank can be divided into 4 equal sections. The original piping feeding the building with surface water (Cedar Lake) was capped and a new line to bring in well water was installed. Water treatment equipment within the aquaculture systems include drum filter, biofilter, degasser, and UV disinfection. Temperature is controlled using a hot water tank and by adjusting the rate of make-up water added.

Total usable rearing area for Lake Sturgeon in Pickerel Place is approximately 27 m<sup>2</sup>. Rearing space is shared between the two stocking programs: Keeyask Hydropower Limited Partnership and the Nelson River Sturgeon Board.

The purpose of this report is to provide a summary of Lake Sturgeon production at Grand Rapids Fish Hatchery and stocking activities for the Keeyask Hydropower Limited Partnership in 2022/23.

Klassen et al. (2015; 2016; 2017; 2018; 2019; 2020; 2021; 2022; 2023) provides summaries from past years.

**Photo 1:** Water recirculating aquaculture systems in Pickerel Place. System 4000 (Right) and system 4100 (Left).

**Photo 2:** Rearing troughs in Pickerel Place used for interim Lake Sturgeon production. Installation of screens allow each tank to be divided into four sections.

## 2.0 BURNTWOOD RIVER POPULATION (2022 YEAR-CLASS)

### 2.1 PAST PRODUCTION AND STOCKING

Wild Lake Sturgeon adults from the Burntwood River were captured downstream of First Rapids (Map 2) in early June 2022. On June 12 the milt (sperm) from four males (M1, M3, M6, M7) was mixed with the eggs from one female (F1). The total number of eggs brought to GRFH was estimated to be 44,350. The overall percentage of viable eggs was estimated to be 84%. The estimated number of hatched larvae was 37,053.

Monthly survival during the spring and summer months remained at or above 60%. Survival during the month of September exceeded 95%.

On September 26 & 28, a total of 3,458 fingerlings were released into Split Lake with assistance from Manitoba Hydro's boat patrol crew. On September 30, a total of 1,739 fingerlings were released from shore into the Burntwood River at the Orr Creek boat launch.

At the time of the fall stocking, fingerlings had an average total length of 95 mm (range: 76 to 106 mm) and average weight of 3.34 g (range: 1.97 to 4.62 g).

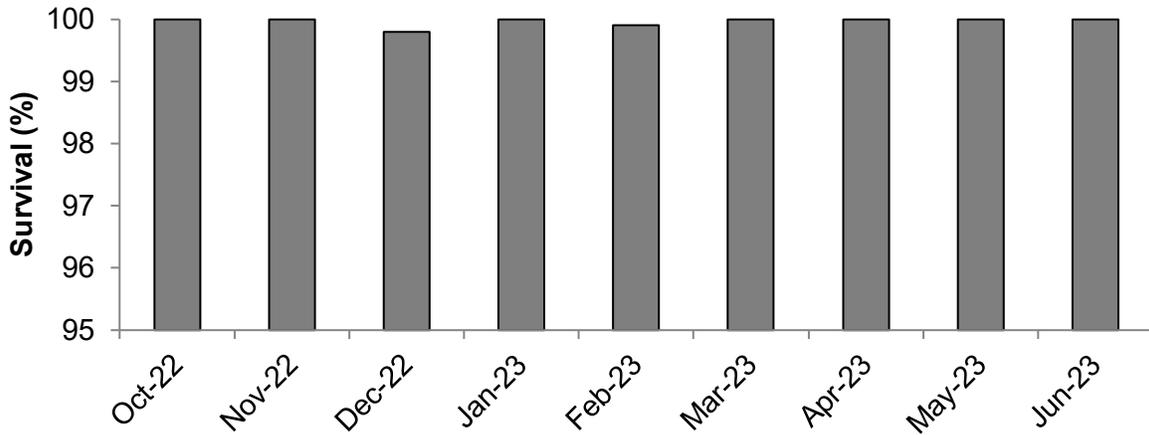

Klassen et al. (2023) provides additional detail on past production and stocking activities for the Burntwood River sturgeon (2022 year-class).

## 2.2 PRODUCTION

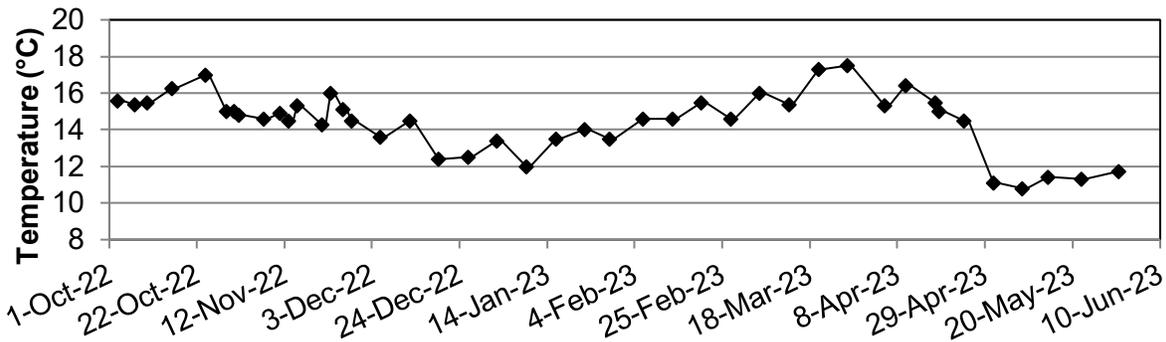

### 2.2.1 WINTER

A total of 800 Lake Sturgeon fingerlings representing four family groups (F1M1, F1M3, F1M6, F1M7) were kept at GRFH over the 2022/23 winter season for further grow-out. Fish were held in Pickerel Place (System 4000). Well water was used exclusively and UV disinfected prior to entering tanks. During the winter grow-out, sturgeon were fed frozen bloodworm twice daily to satiation in the morning and afternoon.

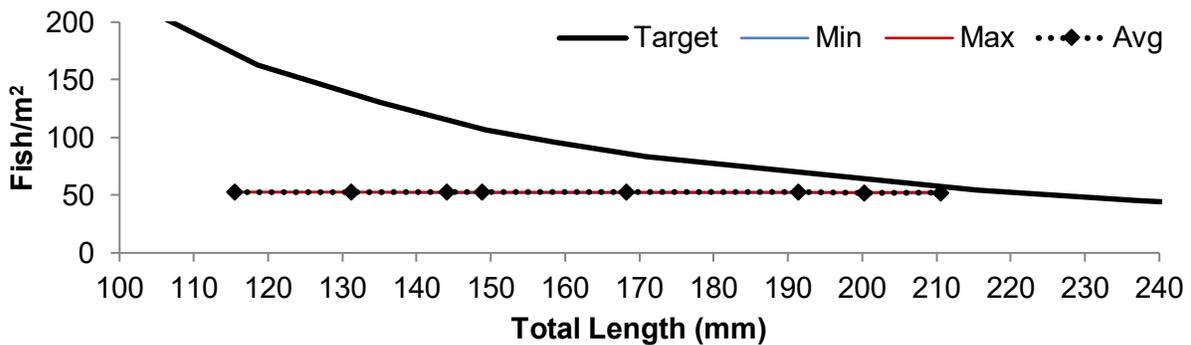

Overwinter survival for the 2022 year-class was 99.6% (Figure 1; Table A1-1). Three fish died naturally (two in December and one in February).

**Figure 1: Monthly survival (%) of Burntwood River sturgeon (2022 year-class) at GRFH from October 1, 2022 to June 1, 2023**

**Figure 2: Water temperatures (°C) in rearing troughs holding Burntwood River sturgeon (2022 year-class) at GRFH from October 1, 2022 to June 1, 2023**

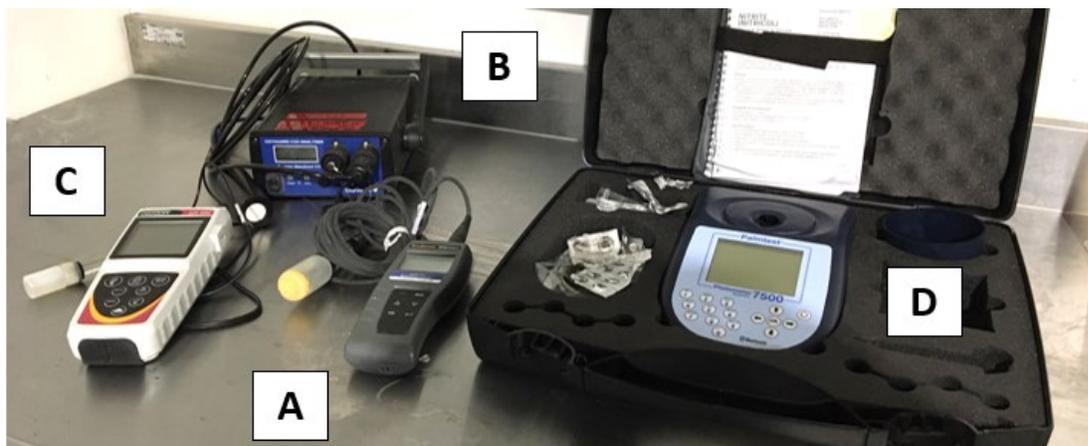

**Figure 3: Average, minimum and maximum rearing density (fish per m²) of Burntwood River sturgeon (2022 year-class) at GRFH from October 1, 2022 to June 1, 2023**

Average tank temperature recorded during water quality assessments was 14.5°C (range: 10.8°C to 17.5°C) from October 1, 2022 to June 1, 2023 (Figure 2).

Average Rearing densities remained at or below historical target levels (Figure 3).

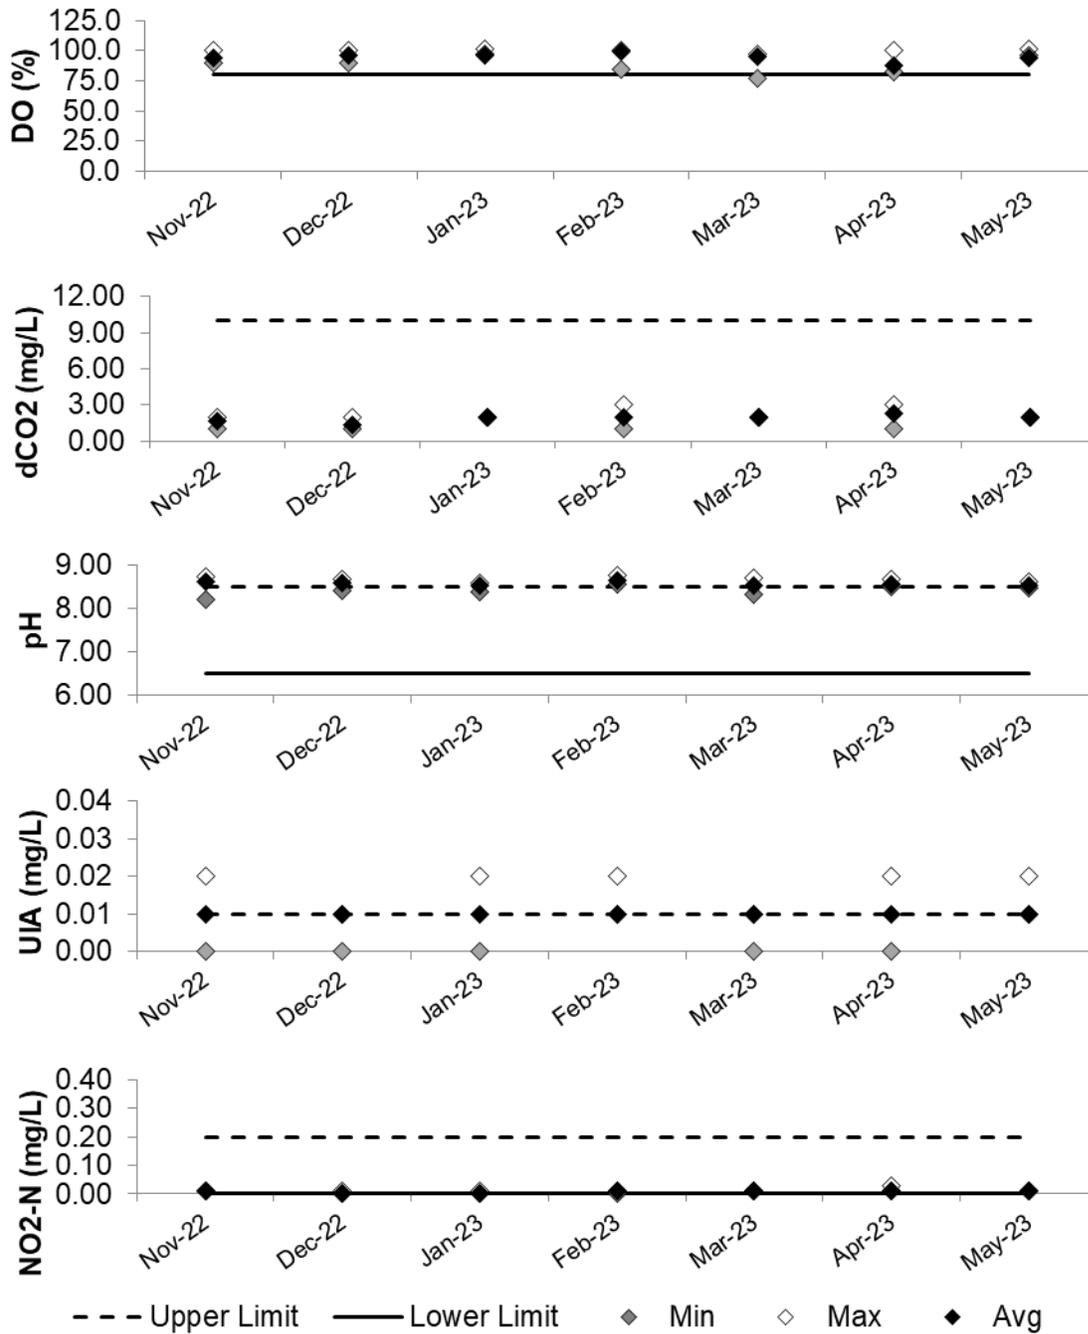

Water quality samples were tested weekly (or more often, if needed) at a system level throughout the winter grow-out period. Measurements included dissolved oxygen (DO; EcoSense DO 200A, Pentair), dissolved carbon dioxide (dCO<sub>2</sub>; GO2P, Oxygaord International), pH (pH450, Oakton Instruments), total ammonia nitrogen (TAN; Photometer 7500, Palintest), un-ionized ammonia (UIA; Calculated by multiplying TAN with a multiplication factor based on temperature and pH, Emerson et al. 1975) and nitrite-nitrogen (NO<sub>2</sub>-N; Photometer 7500, Palintest; Photo 3).

**Photo 3: Equipment used to test dissolved oxygen (A), dissolved carbon dioxide (B), pH (C), total ammonia nitrogen (D) and nitrite-nitrogen (D) at GRFH**

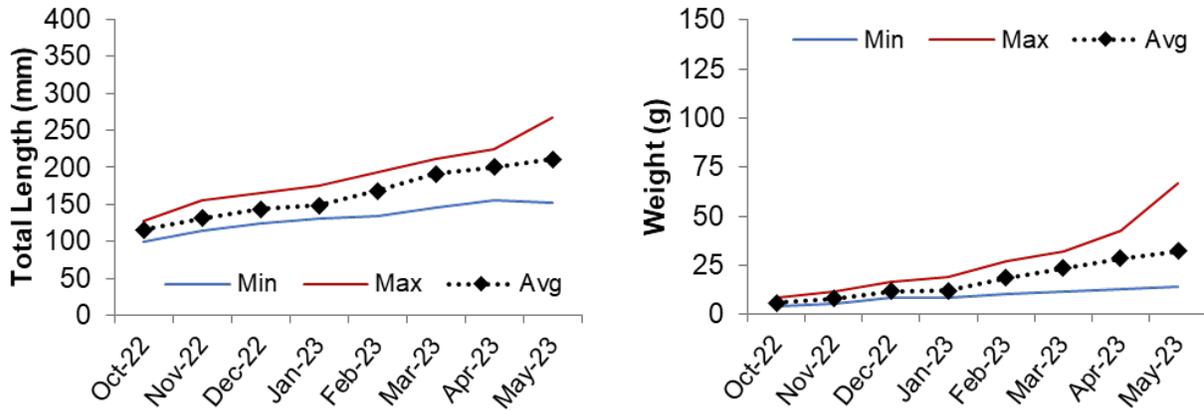

Average, minimum and maximum monthly water quality values, with the exception of TAN, are plotted in Figure 4. A detailed summary of monthly values is presented in Table A1-2. Recommended threshold values for sturgeon production are listed in Table A2-1.

Average monthly values for DO (>80%), dCO<sub>2</sub> (<10 mg/L) and NO<sub>2</sub>-N (<0.2 mg/L) were at or within acceptable limits during winter production. Average monthly values for pH were slightly above recommended thresholds (6.5 to 8.5) throughout most of the winter production and UIA values exceeded recommended limits (<0.01 mg/L) on several occasions. Further upgrades to the hatchery's water treatment equipment are expected to better manage issues associated with the source well water (e.g., iron and mineral build-up within the rearing systems).

**Figure 4: Average, minimum and maximum monthly dissolved oxygen (DO), dissolved carbon dioxide (dCO<sub>2</sub>), pH, un-ionized ammonia (UIA) and nitrite-nitrogen (NO<sub>2</sub>-N) values in the rearing system holding Burntwood River sturgeon (2022 year-class) at GRFH from October 1, 2022 to June 1, 2023**

At the end of each month, 15 Burntwood River sturgeon were randomly selected and measured from each of the four family groups. All fish were measured in mid-May prior to the spring stocking. There was a gradual but steady increase in growth over winter (Figure 5; Table A1-3).

**Figure 5: Average, minimum and maximum total length (mm) and weight (g) for Burntwood River sturgeon (2022 year-class) at GRFH from October 2022 to mid-May 2023**

At the time of the spring stocking, yearlings had reached an overall average fork length of 184 mm (range: 137 to 235 mm), average total length of 211 mm (range: 153 to 267 mm) and average weight of 32.2 g (range: 13.8 to 66.8 g; Figure 5; Table A1-3).

## 2.3 STOCKING

### 2.3.1 SPRING

All Burntwood River sturgeon were marked with uniquely numbered Passive Integrated Transponder (PIT) tags (8 mm long x 1.4 mm diameter) by inserting the tag into the muscle along the fish’s back. This was completed by GRFH staff between April 1-3, 2023 when fish were large enough to undergo the procedure. A PIT tag scanner held over the fish detects the tag and displays the unique number on a screen. This marking technique helps to identify hatchery-reared fish caught in the river and can be used to assess the movement and growth of individual fish following stocking.

Tissue samples (pectoral fin) were collected from 30 Burntwood River sturgeon on April 12, 2023 and sent to RPC Science & Engineering in Fredericton, New Brunswick. All samples tested negative for Namao Virus using a virus specific qPCR test. Yearlings were cleared by the provincial fish health officer for stocking.

On May 30, 2023 a total of 398 sturgeon yearlings were transported by truck from the Grand Rapids Fish Hatchery to meet Manitoba Hydro's boat patrol crews near the stocking location. Following a period of acclimation, the sturgeon were released by boat into Split Lake at site 1 (Map 2; Table 2; Table A1-4). The river temperature at the release site was 12.8°C.

On June 1, another 397 sturgeon were transported by truck to the Orr Creek boat launch. Following a period of acclimation, the sturgeon were released from shore into the Burntwood River at Site 2 (Photo 4; Map 2; Table 2; Table A1-4). The river temperature at shore was 13.6°C.

## 3.0 BIRTHDAY RAPIDS POPULATION (2023 YEAR-CLASS)

### 3.1 SPAWN CAMP

#### 3.1.1 BROODSTOCK COLLECTION

Lake Sturgeon adults were captured from the Nelson River downstream of Birthday Rapids (Map 3) with assistance from North South Consultants. Several milting males were caught between May 28 and June 6; however, no females suitable for use as broodstock were captured.

Male sturgeon were held in a tank set up on shore (photo 5). Average water temperature recorded from the holding tank between May 30 and June 7, 2023 was 12.5°C (range: 9.8 to 13.9°C).

Administration of Gonadotropin Releasing Hormone (GnRH; Product No. H-4070, Bachem Americas, Inc., Torrance, CA, USA) is useful for conservation aquaculture programs because it stimulates the production of sex steroids (estradiol and testosterone) necessary for maturation and production of eggs and milt. Research on the use of GnRH during Lake Sturgeon gamete collection suggests no lasting negative effects on broodstock health or human consumption complications (Genz et al. 2014). However, given that no eggs were available to be fertilized, none of the males were injected with GnRH.

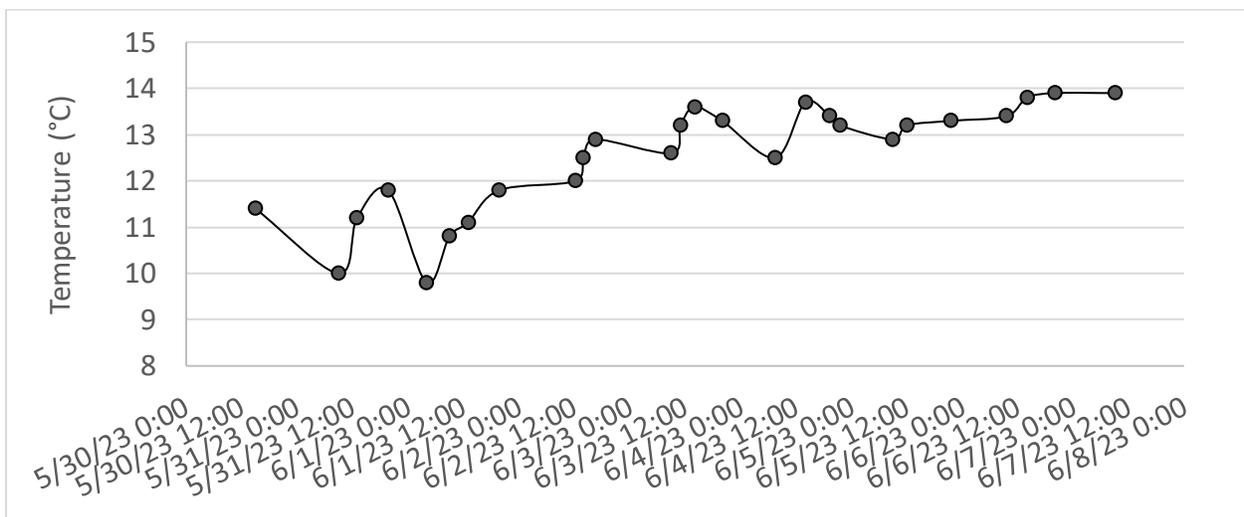

The spawn camp field crew left site on June 8, at which time river temperatures had been over 13°C (the upper limit for spawning) for several days.

**Map 3: Location of Birthday Rapids (A) and the Birthday Rapids Spawn Camp (B)**

**Photo 5: Sturgeon holding tanks at the Birthday Rapids spawn camp, June 2023**

**Figure 6: Water temperature (°C) in the broodstock holding tanks at the Birthday Rapids spawn camp from May 30 to June 7, 2023**

### 3.1.2 BROODSTOCK HEALTH

Netting was secured over the holding tanks (Photo 5) to prevent captured sturgeon from jumping out onto the ground.

All males held at the spawn camp were released back into the river within seven days of capture and appeared to be in good health.

## 4.0 POST-STOCKING RECAPTURES

A total of 6,528 Age-1+ Lake Sturgeon have been stocked into the lower Nelson and Burntwood rivers since 2014 (Burntwood River/Split Lake = 2,914; Keeyask reservoir = 1,686; Stephens Lake = 1,928). PIT tags injected into the sturgeon prior to release has allowed identification of 849 hatchery-reared fish from post-stocking monitoring in the Keeyask Study Area since 2014 (Table 3).

The majority of hatchery-reared sturgeon have been recaptured in Stephens Lake (52%, n = 445). Of these fish, 346 sturgeon were originally stocked into Stephens Lake (2015 = 80; 2017 = 67, 2019 = 184, 2022 = 15) with 98 sturgeon having been stocked upstream. Of these 98 fish, 93 sturgeon were stocked into what is now the Keeyask reservoir (2015 = 18; 2017 = 21; 2019 = 45, 2022 = 9) and five sturgeon were stocked into the Burntwood River (2014 = 1; 2018 = 3, 2021 = 1). The stocking location of one hatchery-reared fish recaptured in Stephens Lake during the 2019 monitoring program is unknown and was either stocked into Stephens Lake or the Keeyask reservoir in 2019. Annual survival of hatchery-reared sturgeon stocked as yearlings in Stephens Lake is currently estimated to be 86% (Dowd and Hrenchuk 2024).

The second most hatchery-reared fish have been recaptured in the Keeyask reservoir (39%, n = 332). Most of these fish were originally stocked in the Keeyask reservoir (2015 = 95; 2017 = 72; 2019 = 115, 2022 = 34), with the exception of 16 individuals that were stocked upstream in the Burntwood River (2014 = 13; 2018 = 3). Annual survival of hatchery-reared sturgeon stocked as yearlings in the Keeyask reservoir is currently estimated to be 95% (Dowd and Hrenchuk 2024).

The least number of hatchery-reared fish recaptured to date has been in the Burntwood River and upper Split Lake area (9%, n = 72). All were stocked into the Burntwood River (2014 = 20; 2016 = 3; 2018 = 39; 2020 = 7, 2021 = 3). Annual survival of hatchery-reared sturgeon stocked as yearlings in the upper Split Lake area is estimated to be 92% (Burnett et al. 2023).

Individuals from all year-classes produced at the Grand Rapids Fish Hatchery (aged 1+) have been recaptured, with the exception of the most recently released 2022 year-class. Over the course of the monitoring program:

- 4% (n = 34) were from the 2013 year-class,
- 23% (n = 193) from the 2014 year-class,
- <1% (n = 3) from the 2015 year-class,
- 19% (n = 160) from the 2016 year-class,
- 5% (n = 45) from the 2017 year-class,
- 41% (n = 345) from the 2018 year class
- 1% (n = 11) from the 2019 year-class, and
- 7% (n = 58) from the 2021 year-class.

At the time of recapture:

- 22% (n = 185) were age-1,
- 14% (n = 115) were age-2,
- 18% (n = 157) were age-3,
- 11% (n = 94) were age-4,
- 16% (n = 137) were age-5,
- 5% (n = 46) were age-6,
- 7% (n = 60) were age-7,
- 3% (n = 25) were age-8,
- 3% (n = 27) were age-9; and
- <1% (n = 3) were age-10.

Additional information about recaptured hatchery-reared sturgeon can be found in Henderson et al. (2015), Burnett et al. (2016; 2017; 2018; 2021; 2022; 2023), Burnett and Hrenchuk (2019; 2020) and Dowd and Hrenchuk (2024).

## 5.0 PRODUCTION AND STOCKING ACTIVITIES IN 2024/25

Grand Rapids Fish Hatchery did not produce Lake Sturgeon for the Keeyask Hydropower Limited Partnership in 2023/24 due to no suitable female being captured near Birthday Rapids during spring gillnetting efforts. As such, no sturgeon are available to be stocked as yearlings in spring 2024. Planning is underway to ensure the best possible chance of collecting eggs in spring 2024.

The new water recirculating systems in the main hatchery building were commissioned in fall 2021; however, issues with the source well water (e.g., iron and calcium scale) has prevented operations from moving back into the main hatchery building. Additional water treatment options were assessed by the project team over the course of 2022. Following additional upgrades including the installation of a hydrogen peroxide dosing system, water chillers and variable frequency drives (VFDs) on the blowers (i.e., air supply to biofilters) operations are planned to resume in the main building by spring 2024.

## 6.0 SUMMARY AND CONCLUSIONS

A total of 795 Burntwood River yearlings consisting of four family groups (F1M1, F1M3, F1M6, F1M7) were released into the Burntwood River (397) and upper Split Lake area (398) in spring 2023. No offspring from the 2023 year-class were produced at Grand Rapids Fish Hatchery due to no gravid females being captured downstream of Birthday Rapids. As a result, there were no fingerlings stocked in the Keeyask area or sturgeon available to retain for release as yearlings in spring 2024.

Stocking activities for the construction and operation of the Keeyask Generating Station will continue until self-sustaining populations are present in the Keeyask and upper Split Lake areas. Assessment of the program is on-going in order to meet this objective. Results from juvenile monitoring programs indicate high survival of the hatchery-reared sturgeon stocked as yearlings but there is little evidence to support survival of the released fingerlings. As such the program will continue to focus on the production and release of yearlings.

Upgrades to the Grand Rapids Fish Hatchery is on-going with completion expected by spring 2024. Once completed, there will be capacity to produce greater numbers of yearlings for stocking.

GRFH filled a new permanent position to support on-going maintenance of the facility's expanding infrastructure.

## **APPENDIX 2: WATER QUALITY THRESHOLD**

**Table A2-1: Reported Lake Sturgeon threshold values for Dissolved Oxygen, Dissolved Carbon Dioxide, pH, Ammonia-Nitrogen and Nitrite Nitrogen**

Parameter	Threshold Values	References
<b>Dissolved O<sub>2</sub> (%)</b>	> 80	Yoon et al 2019 <sup>1</sup>
	> 60	Chebanov and Galich 2011 <sup>2</sup>
<b>Dissolved O<sub>2</sub> (mg/L)</b>	> 6.0	Hochleithner and Gessner 2012 <sup>3</sup>
	> 4.0	Chebanov and Galich 2011
	> 5.0	Mims et al 2002 <sup>4</sup>
	> 6.0	Dettlaff et al 1993 <sup>5</sup>
<b>Dissolved CO<sub>2</sub> (mg/L)</b>	< 10.0	Hochleithner and Gessner 2012
	< 10.0	Chebanov and Galich 2011
<b>pH</b>	6.5 to 8.0	Hochleithner and Gessner 2012
	6.5 to 7.5	Chebanov and Galich 2011
	6.5 to 8.5	Mims et al 2002
	6.5 to 8.0	Dettlaff et al 1993
<b>Ammonia NH<sub>3</sub>-N (mg/L)</b>	< 0.010	Hochleithner and Gessner 2012
	< 0.003	Chebanov and Galich 2011
	< 0.010	Mims et al 2002
<b>Nitrite Nitrogen (mg/L)</b>	0.1 to 0.2	Chebanov and Galich 2011
	< 0.1	Mims et al 2002
